Bayesian Computational Analyses with R is an introductory course on the use and implementation of Bayesian modeling using R software. The Bayesian approach is an alternative to the "frequentist" approach where one simply takes a sample of data and

Example cont.: Consumer preference. Using a prior on θ , we have $l(\theta) = \log(f(x_j | \theta)) \propto \theta^x (1-\theta)^{n-x} + C$. The first derivative is given by $\frac{\partial l(\theta)}{\partial \theta} = \frac{x}{\theta} - \frac{n-x}{1-\theta}$. Equating to zero and solving for θ gives the posterior mode by $\hat{\theta} = \frac{x}{n}$. The second derivative is given by $\frac{\partial^2 l(\theta)}{\partial \theta^2} = -\frac{x}{\theta^2} - \frac{n-x}{(1-\theta)^2}$.

A well written guide to Bayesian R computation, one thing which really bugged me was the fact that the list of commands were given at the end of each chapter thus it can be confusing at first because we are not told what the commands are meant to do. A lot of the ideas could also be elaborated more too.
