The myriad of species interacting in a given area is a biological community. Communities are often identified by their most conspicuous plants or animals, but they also include all of the fungi, protists, and bacteria. A major focus of community ecology explores interactions between species such as predator-prey relationships, competition, and mutualism.

And the answer is, well, yes, the communities do change over time, and there is some initial period where there might not be any life in that habitat, and then life slowly colonizes it, and the makeup of that life will change over time, the makeup of that community. And this general idea is called ecological succession.
