In theoretical computer science and formal language theory, a regular language (also called a rational language) is a formal language that can be defined by a regular expression, in the strict sense in theoretical computer science (as opposed to many modern regular expressions engines, which are augmented with features that allow recognition of non-regular languages).

Programmable logic has widespread software support, so it is relatively easy (using modern design tools) to design a circuit, reduce it to a logic schematic (diagram of connectivity and parameters of logic elements in a circuit), then use a computer to program a special logic device called a PLA (programmable logic array).
