Quadratic inequalities are one type of polynomial inequality. Other examples of polynomial inequalities are $-2x^4 + x^2 - 3 > 7$, $(\frac{2}{3})x + 4 \leq 0$, and $4x^3 - 2x^2 > 5x + 7$. When the inequality symbol in a polynomial inequality is replaced with an equals sign, a related equation is formed. Polynomial inequalities can be easily solved once the ...

The polynomial function is fine, and it does evaluate to zero at the known roots which are integers. It is subtle, but up to that point, we are using only integers, which can be represented exactly. The roots function is evidently using some float math, and the floats are not the same as the integers.
